

Custom data directory

Mnemosyne can use any custom data directory.

For Linux and Mac OS X, just use the `-d` option at the command line:

```
mnemosyne -d /foo/bar
```

For Windows, open a command prompt (Start-> All Programs-> Accessories-> System-> Command Prompt) and type:

```
"C:\Program Files\Mnemosyne\Mnemosyne.exe" -d your_custom_data_dir
```

Alternatively, you can create a shortcut on your desktop, right-click it, choose "Properties" and under "Target" add the `-d` argument.
